Examination play a very important role in college and it is held at regular intervals. During the examination there may be a shortage of question paper, answer sheet, malpractice, staff alteration and other requirement of student (like Water, Graph and Data Book). For these issues the examiner has to depend on a man power to convey this information to exam cell. This process is time consuming and the student requirement may not be fulfilled at the right time. In order to solve the above issues a remote keypad module is given to the invigilator. When they press any of those keys, then a signal is sent to the Exam cell via Tarang communication and the notification will be displayed in the virtual panel in the Exam cell so the concerned person can act accordingly to solve the issue. At the same time information will also be passed to the Exam cell coordinator through GSM. Thus this project is mainly designed for helping the exam invigilators to have a sophisticated and communication between the Examination hall and the Exam coordinating cell.
